Commonly used LBM, is given by (1)  $f_i(x+e_i\Delta t, t+\Delta t) - f_i(x, t) = -1/\tau (f_i(x, t) - f_i^{eq}(x, t))$ , where  $f_i(x, t)$  and  $f_i^{eq}(x, t)$  are the particle and equilibrium distribution functions at  $(x, t)$ ,  $e_i$  is the particle velocity along the  $i$ th direction and  $\tau$  is the single-relaxation-time parameter that controls the rate of approach to equilibrium.

**Fluid Simulation.** Instead of solving the Navier–Stokes equations directly, a fluid density on a lattice is simulated with streaming and collision processes. The method is versatile as the model fluid can straightforwardly be made to mimic common fluid behaviour like vapour/liquid coexistence, and so fluid systems such as liquid droplets can be simulated. Also ...
