Enhanced Interior Gateway Routing Protocol (EIGRP) went through a similar creation process as compared to RIP, but with the work happening inside Cisco. Cisco has already created the Interior Gateway Routing Protocol (IGRP) in the 1980s, and the same needs that drove people to create RIPv2 and OSPF drove Cisco to improve IGRP as well.

was developed by Cisco Systems as a proprietary protocol, which can be used only on Cisco routers but in 2013 partial functionality of EIGRP was converted to an open standard. EIGRP only sends incremental updates, reducing the workload on the router and the amount of data that needs to be transmitted.

EIGRP Terminology and Operation.  
EIGRP sends out five different types of  
packets—hello, update, query, reply,  
and acknowledge (ACK)—that are  
used to establish the initial adjacency  
between neighbors and to keep the  
topology and routing tables current.  
When troubleshooting an EIGRP  
network, network administrators must  
understand what EIGRP packets are  
used for and how they are exchanged.

Internet Protocol (IP) networks but also for AppleTalk and Novell NetWare networks. Using EIGRP, a router keeps a copy of its neighbor's routing tables. If it can't find a route to a destination in one of these tables, it queries its neighbors for a route and they in turn query their neighbors until a route is found.

EIGRP is commonly the routing protocol of choice when using an ALL Cisco network with no requirement for cross-vendor operation. EIGRP supports the use of multiple routed protocols such as IP, IPX, AppleTalk.
