Textbook of Assisted Reproductive Techniques has become a classic comprehensive reference for the whole team at the IVF clinic. The fourth edition comes more conveniently as a set of two separate volumes, one for laboratory aspects and the other for clinical applications. The text has been extensively revised, with the addition of several important new contributions on laboratory aspects including developing techniques such as PICSi, IMSI, and time-lapse imaging. The second volume focuses on clinical applications and includes new chapters on lifestyle factors, tailored ovarian stimulation, frozen-thawed embryo transfer, viral disease, and religious perspectives. As before, methods, protocols, and techniques of choice are presented by eminent international experts. The two volume set includes: ? Volume One - Laboratory Perspectives ? Volume Two - Clinical Perspectives

Already established as a classic comprehensive reference for the whole team at the IVF clinic, this new edition has been extensively revised, with the addition of several important new contributions on laboratory ( including advanced sperm selection techniques for ICSI, human embryo biopsy procedures, oocyte activation, managing an oocyte bank, artificial gametes, and epigenetics) as well as on clinical topics (including GnRH agonist triggering, segmentation of IVF treatment, uterus transplantation, and risk and safety management). As previously, methods, protocols, and techniques of choice are presented by eminent contributors internationally.

Established as a definitive reference for the IVF clinic, the fifth edition has been extensively revised, with the addition of several important new contributions on laboratory topics, including advanced sperm selection techniques for ICSI, human embryo biopsy procedures, oocyte activation, managing an oocyte bank, artificial gametes, and epigenetics. As previously, methods, protocols, and techniques of choice are presented by IVF pioneers and eminent international experts.

Now in its revised and expanded second edition - including over 20 new chapters - this comprehensive textbook remains a unique and accessible description of the current and developing diagnostic and treatment techniques and technologies comprising in vitro fertilization (IVF). Arranged thematically in sections, each chapter covers a key topic in IVF in a sensible presentation. Parts one and two describe the planning, design and organization of an ART unit and IVF laboratory and equipment and systems, respectively. The sections that follow provide detailed descriptions of IVF techniques, embryo culture methods, sperm processing and selection, insemination procedures, micromanipulation, embryo evaluation, cryopreservation, and embryo transfer. Concluding sections address issues of management and regulation of ART labs across the globe, as well as special topics and emerging techniques and devices. Chapter authors, all experts in the field, contribute their expertise from around the world. With the addition of learning key points and review questions at the beginning and end of each chapter, this new edition of In Vitro Fertilization is a readily accessible, high quality instructional resource for reproductive medicine trainees at all levels. Practicing reproductive endocrinologists, urologists, and embryologists also will find value in the book, as will infertility researchers.

Infertility, as with many aspects of medicine, is at the mercy of rapid technological advance. Many of these developments initially seem attractive to both clinicians and patients, but need to be rigorously assessed if their real value is to be understood and clinical practice is to develop. In this book issues of importance to the management of infertile patients are discussed. The gaps in our knowledge which prevent a better understanding of the condition are identified, and recent developments, both clinical and scientific, are subjected to peer review and discussion. An important feature of the book is an acceptance that training in infertility practice is a real problem. This is perceived not only by the practising clinicians, both doctors and nurses, but particularly by the clinical scientists, including embryologists, who now provide such an essential part of the service. Similarly the provision of the clinical service has been examined in detail from a variety of standpoints, in an attempt to make sensible recommendations which balance real need with limited resource. The book is based on the papers presented and discussed at the 25th RCOG Study Group held in April 1992. The discussion after each paper was civilised but uncompromising and forms an important part of this publication. The rapid processing of the written and recorded material by the staff at the RCOG, and particularly Miss Sally Barber, has ensured that the book has been produced while the issues are live, the reviews contemporary and the discussion relevant.

Advances in cancer diagnosis and the introduction of new cancer treatments have dramatically improved survival rates. So currently it's the need of the hour to think well beyond the cure to the future quality of life of these cancer survivors. A cancer diagnosis is a devastating situation for young cancer patients and their families. Cancer and its therapy have a detrimental effect on fertility. Fertility preservation has now become a new paradigm in survivorship. It has been well documented that cancer and cancer treatment resulting in infertility is psychologically distressing for many patients, but those who have undergone fertility preservation have coped better with cancer therapies. This book is our effort to give an overview of fertility preservation in detail which will help to bridge the gap between the Oncology and Fertility Team and to develop well-coordinated, easily accessible referral pathways for cancer patients of reproductive age group.

This essential survival guide for successfully managing the modern-day IVF clinic condenses a wealth of expertise and experience from the authors in troubleshooting and implementing quality management in the IVF laboratory. With high-profile media coverage of mistakes at IVF clinics, and escalating regulatory scrutiny, there is increasing pressure for professional accreditation. Modern accreditation schemes, which are largely based on the principles of ISO 9001 and related standards, require Quality Systems. Yet quality management beyond basic assay quality control is often poorly understood by biomedical scientists outside clinical chemistry laboratories. Quality and risk management are thus becoming hot topics for those working in IVF clinics and this book brings together, for the first time in one place, the basics of these essential aspects of laboratory management. The focus on taking a holistic approach to 'prophylactic management' - prevention rather than cure - will be welcomed by all scientists working in IVF.

Vitrification in Assisted Reproduction presents standard and new cryopreservation techniques in detail, outlining those that have resulted in success, and providing recommended means for overcoming typically encountered problems. This new edition provides a much broader range of clinical application and data to demonstrate its contribution to the us
