Optical-fiber-based telecommunication networks have become a major information-transmission-system, with high capacity links encircling the globe in both terrestrial and undersea installations. Numerous passive and active optical devices within these links perform complex transmission and networking functions in the optical domain.

Typically, optical fiber is made of thin and solid strands of glass. In this case, we are using plastic optical fiber with 1000µm diameter. The hole in the ST connector is also 1000µm in diameter. Plastic optical fiber is not popular in long distance nor is it popular in high frequency applications.

Fiber-optic communication systems technology continues to evolve rapidly. In the last five years alone, the bit rate of commercial point-to-point links has grown from 2.5 Gb/s to 40 Gb/s-and that figure is expected to more than double over the next two years! Such astonishing progress can be both inspiring and frustrating for professionals who need to stay abreast of important new developments ...
